

RZR PRO XP SLIP-ON EXHAUST INSTALLATION

Thank you for purchasing your exhaust from AA! This exhaust is designed to increase airflow and eliminate the heat created by the factory catalytic converter and restrictive muffler design. We highly recommend AA custom tuning when using this exhaust as it will increase horsepower and help lower heat. You'll notice much better sound from this exhaust that will have everyone's heads turning (in a good way!). The exhaust sound is also adjustable with our optional quiet cap. This cap can plug one exhaust outlet with a simple bolt, and will decrease sound levels by 4-5db's. This cap will not decrease horsepower as one of the 2.5" holes is plenty of flow unless running over 23lbs of boost on turbo models. You also have the option to install your factory spark arrestor. If you wish, you can pick up another factory spark arrestor and run 2 of them (if not running the quiet core). Installation is easy, just follow the instructions below.

- Remove your rear factory heat shield with a T40 torx bit
- You can use the factory shield with our exhaust if you wish, but many will remove it. If you don't want to run the factory shield; remove the lower brackets from the frame, and re-install the two T40 torx bolts that hold the upper plastic to their frame mounts.
- Remove all springs from your factory muffler using a spring hook tool
- Remove the 3 nuts holding your muffler to the header on turbo models. We normally spray with penetrating oil before removal, and sometimes will use a small amount of heat on the bolts if they feel stubborn.
- Remove the factory muffler from the machine
- Slide your AA muffler into place aligning the push through mounts
- Hold the muffler in place and align your header studs on the muffler
- Use the supplied washers and pins to pin the lower mounts to the frame. Use the washers against the frame and then push the pins through the drilled holes to secure the exhaust.
- Bolt your header to the muffler using the factory studs & nuts
- Use 2 of your factory springs on the spring tabs to secure the muffler even further
- Check muffler for good fitment and call if you have any issues BEFORE running.
- Go ride and enjoy more power, less exhaust heat, and most importantly... a great sounding RZR!
